

WHAT IS AT STAKE – A CASE STUDY

A study, drawing on the estimates of South Africa's three principal gold companies – AngloGold Ashanti, Harmony and Sibanye – indicates that, for one mine, every 1g/t reduction in the cut-off grade would result in 10Mt of additional ore containing 200t of gold to be mined over the operation's extended life.

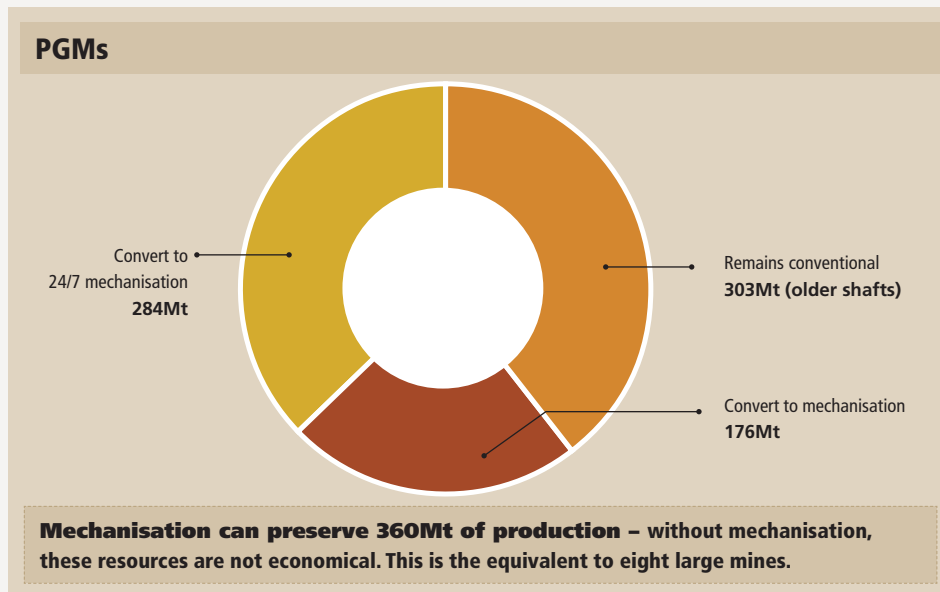

This is an indication of the benefits of using full-mechanised mining techniques operating 24/7. Extrapolating this across the industry as a whole – to its currently working and dormant mines – profitable gold-mining operations might be expected to continue well beyond the year 2045. Looked at as a whole, with conventional mining, the industry can look forward to a sharp decline in gold production by 2019-20 and for mining to die out almost completely by 2033. The picture changes radically with mechanisation: annual output persists at current levels until at least 2025 and until 2030 or even beyond with 24/7, mechanised operations.

GOLD MINES TEC

GOLD TONNES PER YEAR

Similar considerations apply to South Africa's platinum mine although their resources are nowhere near exhaustion as those of the gold mines.

IN CONCLUSION

If this process of modernisation and the manufacture of high-tech, robust and specialised mining equipment is to be achieved, an *ad hoc* approach cannot be contemplated. The industry, manufacturers, researchers and developers will need to collaborate to the full, sharing their knowledge and skills for a common good. The aims are to develop, manufacture and use remotely controlled mobile equipment to break, load and haul ore continuously. Breaking will need to be explosives-free, and the equipment must, as far as possible, be self-correcting. However, work on developing continuous miners that satisfy these criteria has yet to begin in earnest.

Learning from the past and, particularly from past mistakes, the R&D process will need to be carefully planned and carried out:

- It must create an environment where everyone (all stakeholders) want it to succeed
- The R&D structure must not slow down progress
- Mechanised: a 50% reduction in cost per ounce, as well as zero-harm operations
- 24/7 mechanised: a step-change improvement in costs
- A mechanised implementable solution in three to five years
- A workable 24/7 rock breaking system in 10 to 15 years
- Learn from the past: successes and failures
- Restrict any tendencies to return to conventional mining and allay any resistance to change
- Allow sufficient time for maturity at each phase of R&D

The process cannot be completed overnight, so we have to prepare for a staged approach that may differ in the gold and PGMs sectors.

The first part of the venture should build on existing knowledge in the gold and PGMs sectors. The eventual objectives are systems that combine to deliver 24/7 mechanised operations with costs that permit the exploitation of ores at significantly lower cut-off grades. Extensive and fundamental research is required into mine-worthy, reliable, non-explosive rock breaking in a hard and high-stress rock environment. Targets and milestones will be exacting but reach for the stars has always motivated humankind.
